1. (currently amended) A body fluid sampling system for use on a tissue site, the system comprising:

a disposable;

a penetrating member driver;

a plurality of penetrating members arranged in a radial configuration in the disposable wherein sharpened distal tips of the penetrating members point radially outward;

wherein an active one of said penetrating members may be operatively coupled to said penetrating member driver, said penetrating member driver moving said active one along a path out of a housing having a penetrating member exit, into said tissue site, stopping in said tissue site, and withdrawing out of said tissue site;

a processor coupled to the penetrating member driving configured to provide instructions to the penetrating member driver for a fast-into of penetrating members into a tissue site and slow-out velocity out of the tissue site; and

a plurality of analyte detecting members positioned in the disposable, wherein at least one of said analyte detecting members is positioned to receive fluid from a wound created by said active one of said penetrating members, wherein said detecting members are not pierced by the active one of the penetrating members.
